

Fig A.14 shows 2 different bolt, one being able to nicely hang in the slot while the other rests on the slot

Downstream is where the separation of large and small male fasteners begin. Below you can see represented by the red arrows, the male fasteners that are hanging in the slot will be able to pass through a blocker as their profile is now shorter as a result of hanging in the slots, whereas the larger male fasteners represented by the blue arrows may either slide and free fall into the large opening, or will be blocked and also fall into the large opening to the next module below for further separation of the next ranges of male fastener thread sizes.
